

2.1 NMAP

Primero se puede comenzar realizando un escaneo de nmap desde metasploit con el siguiente comando:

```
db_nmap <ip_maquina_objetivo>
```

Como resultado deberíamos recibir un listado de puertos abiertos indicando que servicio provee cada uno:

```
msf6 > db_nmap 192.168.56.9
[*] Nmap: Starting Nmap 7.94SVN ( https://nmap.org ) at 2025-05-02 11:03 EDT
[*] Nmap: Nmap scan report for 192.168.56.9
[*] Nmap: Host is up (0.0011s latency).
[*] Nmap: Not shown: 977 closed tcp ports (reset)
[*] Nmap: PORT      STATE SERVICE
[*] Nmap: 21/tcp    open  ftp
[*] Nmap: 22/tcp    open  ssh

2.2 Metasploit port scanner Alternativamente también se puede usar el módulo de escaneo de metasploit, para ello podemos seleccionarlo con el siguiente comando:

```
use auxiliary/scanner/portscan/tcp
```

Una vez seleccionado el módulo, hay que configurar sus parámetros, podemos ver los parámetros disponibles con el siguiente comando.

```
show options
```

```
msf6 > use auxiliary/scanner/portscan/tcp
msf6 auxiliary(scanner/portscan/tcp) > show options

Module options (auxiliary/scanner/portscan/tcp):

  Name          Current Setting  Required  Description
  --          -
  CONCURRENCY    10              yes       The number of concurrent ports to check per host
  DELAY          0              yes       The delay between connections, per thread, in milliseconds
  JITTER         0              yes       The delay jitter factor (maximum value by which to +/- DELAY) in milliseconds
  PORTS          1-10000         yes       Ports to scan (e.g. 22-25,80,110-900)
  RHOSTS         yes             yes       The target host(s), see https://docs.metasploit.com/docs/using-metasploit/basics/using-metasploit.html
  THREADS        1              yes       The number of concurrent threads (max one per host)
  TIMEOUT        1000           yes       The socket connect timeout in milliseconds

View the full module info with the info, or info -d command.
